## Sine Law

The **Sine Law** is given by,

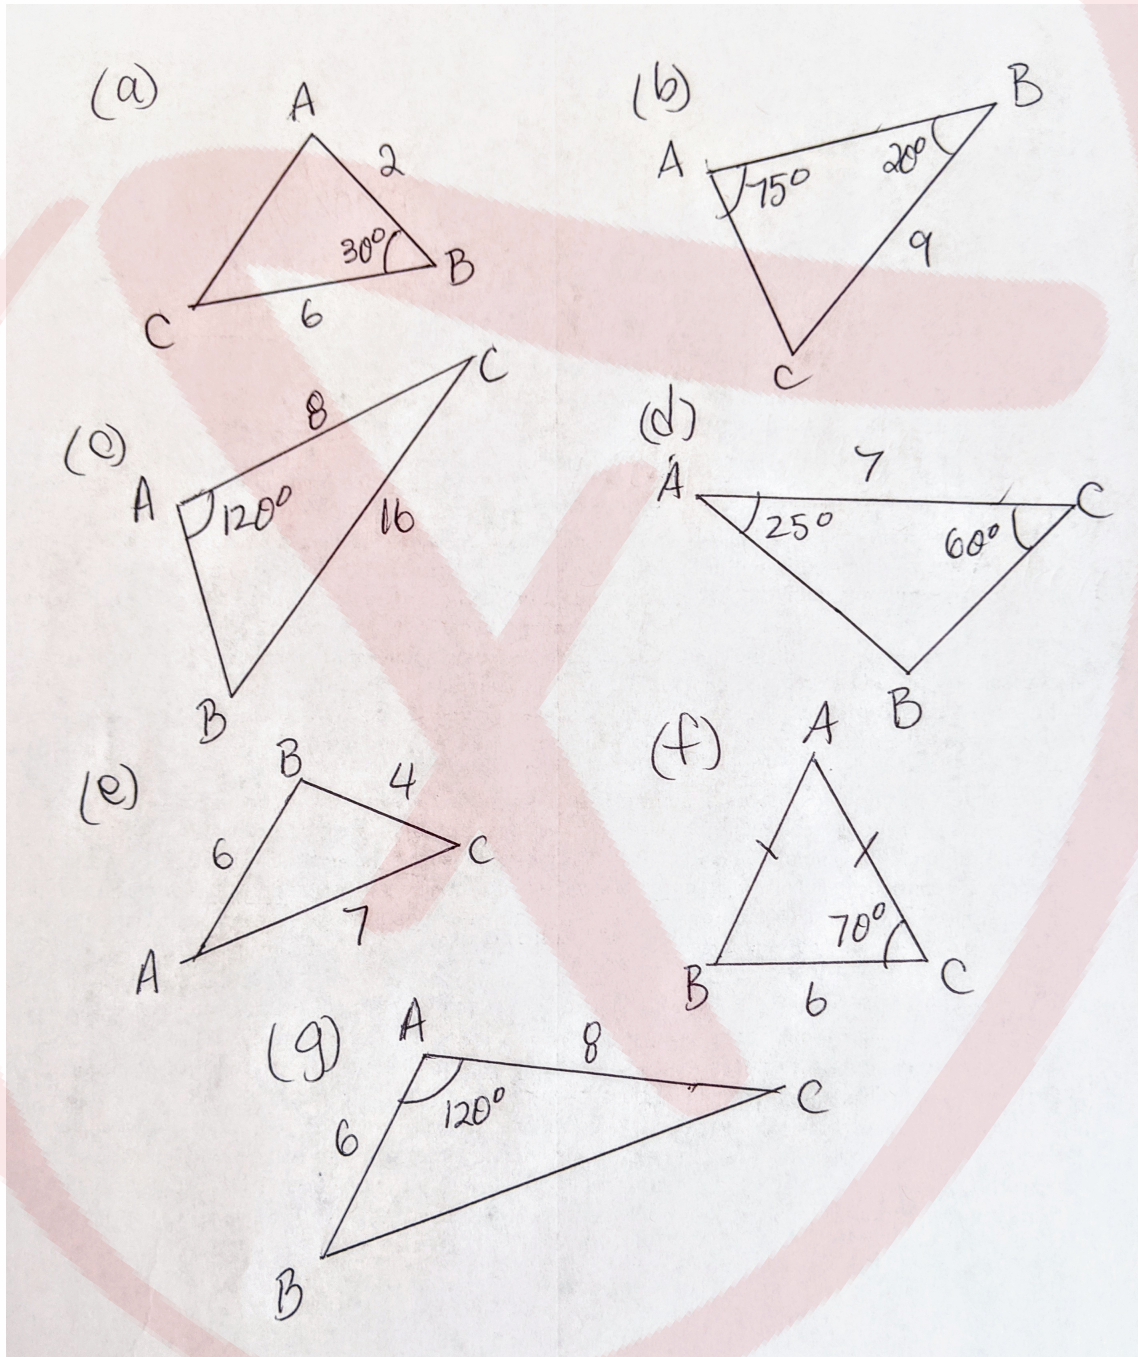

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

So far we have only been able to find the sine, cosine and tangent for angles in a right angled triangle. However, not all triangles are right angle. Other relationships or trigonometric laws are available to deal with these situations. The first is the **Sine Law**. The sine law is useful when,

1. Two angles and a side length of a triangle are given.
2. Two side lengths and an angle are given.
3. All angles are given.

## Exercises

Solve the following triangles.

Solve the following triangles for  $x$ .
