What is the composition of functions?

The composition of functions means, one function is inserted into the another funcionn where a variable would normally go. If we consider functions $f(x)$ and $g(x)$, the composition of two functions f and g means, the function g is inserted into the function f as the value of x, or $x = g(t)$ for $f(x)$. Let's a look at an example to get a better idea of what this means and looks like.

Example

Let's look at the compostion of two plynomials. For example, let's consider

$$f(x) = x^2 + 3x - 1 \ \ and \ g(t) = t + 1.$$

What is the composition of f and g or in notation, what is $f \circ g$?

Solution　　The compoistion of f and g looks like,

$$f \circ g(t) \ \ or \ f(g(t))$$

and is given by,

$$
\begin{aligned}
f(g(t)) &= f(t+1), \text{ where } x = g(t) = t + 1 \\
&= (t+1)^2 + 3(t+1) - 1 \\
&= (t^2 + 2t + 1) + (3t + 3) - 1 \\
&= t^2 + 2t + 1 + 3t + 3 - 1 \\
\therefore f(g(t)) &= t^2 + 5t + 3
\end{aligned}
$$

is the resulting polynomial.
Let's try another example.

Example

Given $f(x) = 2 - x$ and $g(x) = \frac{2}{5-x}$ determine $f \circ g(x)$ and $g \circ f(x)$.

Solution: Let's start with $f \circ g(x)$.

$$
\begin{aligned}
f(g(x)) &= f\left(\frac{2}{5-x}\right) = 2 - \frac{2}{5-x} = \frac{2(5-x) - 2}{5-x} \\
&= \frac{10 - 2x - 2}{5-x} = \frac{8 - 2x}{5-x}
\end{aligned}
$$

Therefore, $f(g(x)) = \frac{8-2x}{5-x}$.
   Now $g \circ f(x)$.

$$
g \circ f(x) = g(2 - x) = \frac{2}{5 - (2-x)} = \frac{2}{5 - 2 + x} = \frac{2}{3+x}
$$

Therefore, $g(f(x)) = \frac{2}{3+x}$.

Exercises

For the following pairs of functions determine $f \circ g(x)$ and $g(f(x))$.

(a) $f(x) = 2 - x^2$ and $g(x) = 4x + 3$

(b) $f(x) = \frac{1}{2}x - x^3$ and $g(x) = -4x$

(c) $f(x) = 2 - x + 2x^2$ and $g(x) - 2x^2 + x^{-2}$

(d) $f(x) = \frac{1}{x-1}$ and $g(x) = \frac{2}{5-x}$

(e) $f(x) = 2x + 3$ and $g(x) = x - 4$

(f) $f(x) = \frac{1}{x^2}$ and $g(x) = 5 - x^2$
